1.1. PERIODIC FUNCTIONS

(PTU Dec. 2012, May 2014)

A function $f(x)$ which satisfies the relation $f(x + T) = f(x)$ for all real x and some fixed T is called a periodic function. The *smallest positive number* T , for which this relation holds, is called the **period** of $f(x)$.

If T is the period of $f(x)$, then $f(x) = f(x + T) = f(x + 2T) = \dots = f(x + nT) = \dots$

Also, $f(x) = f(x - T) = f(x - 2T) = \dots = f(x - nT) = \dots$

$\therefore f(x) = f(x \pm nT)$, where n is a positive integer.

Thus, $f(x)$ repeats itself after periods of T .

For example, $\sin x$, $\cos x$, $\sec x$ and $\operatorname{cosec} x$ are periodic functions with period 2π .

Since $\tan(\theta + \pi) = \frac{\sin(\pi + \theta)}{\cos(\pi + \theta)} = \frac{-\sin\theta}{-\cos\theta} = \tan\theta$

and $\cot(\theta + \pi) = \frac{\cos(\pi + \theta)}{\sin(\pi + \theta)} = \frac{-\cos\theta}{-\sin\theta} = \cot\theta$.

Therefore $\tan\theta$ and $\cot\theta$ are periodic functions with period π .

The functions $\sin nx$ and $\cos nx$ are periodic with period $\frac{2\pi}{n}$.

The sum of a number of periodic functions is also periodic. If T_1 and T_2 are the periods of $f(x)$ and $g(x)$, then the period of $af(x) + bg(x)$ is the least common multiple of T_1 and T_2 .

For example, $\cos x$, $\cos 2x$, $\cos 3x$ are periodic functions with periods 2π , π and $\frac{2\pi}{3}$ respectively.

$\therefore f(x) = \cos x + \frac{1}{2}\cos 2x + \frac{1}{3}\cos 3x$ is also periodic with period 2π , the LCM of 2π , π and $\frac{2\pi}{3}$.

1.2. FOURIER SERIES

(PTU May 2012)

Expansion of a function $f(x)$ in a series of sines and cosines of multiples of x was developed by French Mathematician and physicist Jacques Fourier.

We have seen how a function can be expanded in powers of x by Maclaurin's theorem but that expansion was possible only when the function and its derivatives are continuous. A need arises to expand functions which have discontinuities in their values or derivatives.

By Fourier series, we can expand both type of functions under certain conditions as an infinite series of sines and cosines of x and its integral multiples.

Fourier series for the function $f(x)$ in the interval $c < x < c + 2\pi$ is given by

$$f(x) = \frac{a_0}{2} + \sum_{n=1}^{\infty} a_n \cos nx + \sum_{n=1}^{\infty} b_n \sin nx$$

where

$$a_0 = \frac{1}{\pi} \int_c^{c+2\pi} f(x) dx$$

$$a_n = \frac{1}{\pi} \int_c^{c+2\pi} f(x) \cos nx dx$$

$$b_n = \frac{1}{\pi} \int_c^{c+2\pi} f(x) \sin nx dx$$

Above formulae are also called Euler's formulae. Constants a_0 , a_n and b_n are called Fourier coefficients of $f(x)$.
(PTU May 2013, Dec. 2014)

Remark. To write $\frac{a_0}{2}$ instead of a_0 is a conventional device to be able to get more symmetric formulae for the coefficients.

Note. To determine a_0 , a_n and b_n , we shall need the following results: (m and n are integers)

$$(i) \int_c^{c+2\pi} \sin nx dx = \left(\frac{-\cos nx}{n} \right)_c^{c+2\pi} = 0, n \neq 0; \int_c^{c+2\pi} \cos nx dx = \left(\frac{\sin nx}{n} \right)_c^{c+2\pi} = 0, n \neq 0$$

$$(ii) \int_c^{c+2\pi} \sin mx \cos nx dx = 0, m \neq n \quad (iii) \int_c^{c+2\pi} \cos mx \cos nx dx = 0, m \neq n$$

$$(iv) \int_c^{c+2\pi} \sin mx \sin nx dx = 0, m \neq n$$

$$(v) \int_c^{c+2\pi} \cos^2 nx dx = \pi, n \neq 0; \int_c^{c+2\pi} \sin^2 nx dx = \pi, n \neq 0$$

$$(vi) \int_c^{c+2\pi} \sin nx \cos nx dx = \frac{1}{2} \int_c^{c+2\pi} \sin 2nx dx = 0, n \neq 0$$

$$(vii) \int e^{ax} \sin bx dx = \frac{e^{ax}}{a^2 + b^2} (a \sin bx - b \cos bx) + c$$

$$(viii) \int e^{ax} \cos bx dx = \frac{e^{ax}}{a^2 + b^2} (a \cos bx + b \sin bx) + c$$

(ix) To integrate the product of two functions, one of which is a power of x , we apply the generalised rule of integration by parts. If dashes denote differentiation and suffixes denote integration w.r.t. x , the rule can be stated as follows :

$$\int uv dx = uv_1 - u'v_2 + u''v_3 - u'''v_4 + \dots, \text{ where } u \text{ and } v \text{ are functions of } x.$$

i.e., Integral of the product of two functions

= 1st function \times integral of 2nd - go on differentiating 1st, integrating 2nd, signs alternately +ve and -ve.

[Simplification should be done only when the integration is over].

e.g.,

$$\int x^2 \cos nx dx = x^2 \left(\frac{\sin nx}{n} \right) - 2x \left(\frac{-\cos nx}{n^2} \right) + 2 \left(-\frac{\sin nx}{n^3} \right)$$

$$= \frac{x^2}{n} \sin nx + \frac{2x}{n^2} \cos nx - \frac{2}{n^3} \sin nx.$$

(x) $\sin n\pi = 0$ and $\cos n\pi = (-1)^n$

$$\sin \left(n + \frac{1}{2} \right) \pi = (-1)^n \text{ and } \cos \left(n + \frac{1}{2} \right) \pi = 0, \text{ where } n \text{ is an integer.}$$

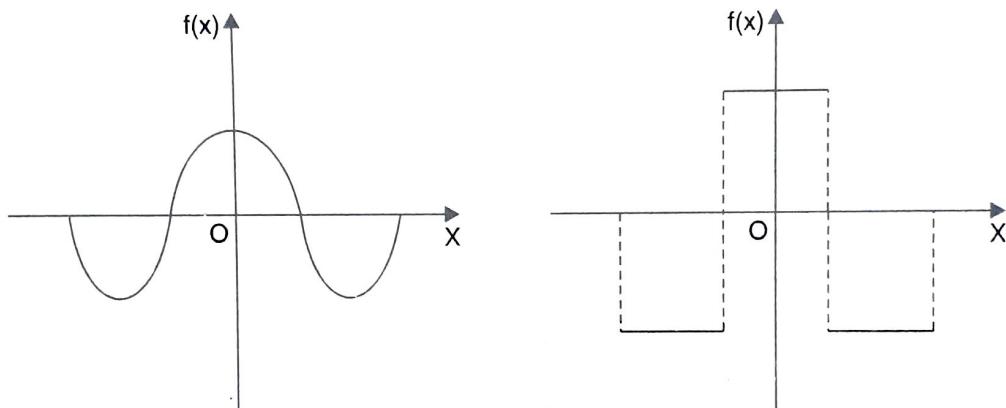

1.3. EVEN AND ODD FUNCTIONS

(PTU May 2007, Dec. 2014)

A function $f(x)$ is said to be *even* if $f(-x) = f(x)$ e.g., x^2 , $\cos x$, $\sin^2 x$ are even functions. The graph of an even function is symmetrical about the y -axis.

Here y -axis is a mirror for the reflection of the curve.

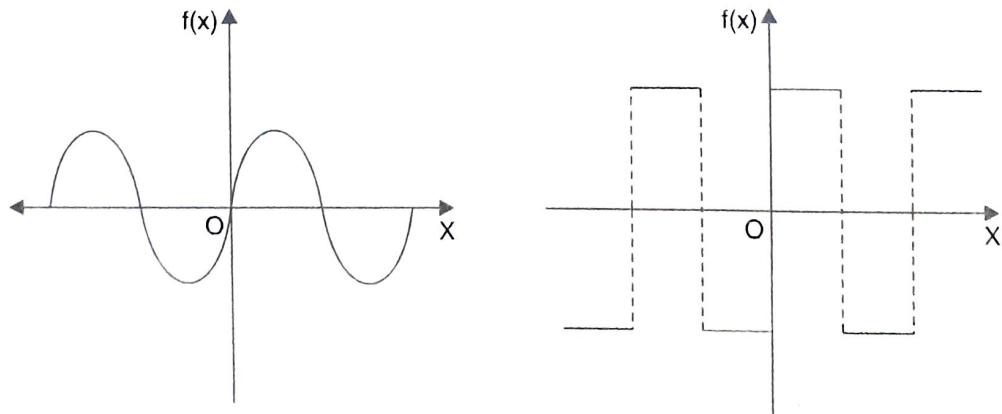

$$\int_{-\pi}^{\pi} f(x) dx = 2 \int_0^{\pi} f(x) dx$$

Graphs of even functions

A function $f(x)$ is said to be *odd* if $f(-x) = -f(x)$ e.g., x^3 , $\sin x$, $\tan^3 x$ are odd functions. The graph of an odd function is symmetrical about the origin.

$$\int_{-\pi}^{\pi} f(x) dx = 0$$

Graphs of odd functions

The product of two even functions or two odd functions is an even function while the product of an even function and an odd function is an odd function.

1.4. EULER'S FORMULAE

The Fourier series for the function $f(x)$ in the interval $c < x < c + 2\pi$ is given by

$$f(x) = \frac{a_0}{2} + \sum_{n=1}^{\infty} a_n \cos nx + \sum_{n=1}^{\infty} b_n \sin nx \quad \dots(1)$$

In finding the co-efficients a_0 , a_n and b_n , we assume that the series on the right hand side of (1) is uniformly convergent for $c < x < c + 2\pi$ and it can be integrated term by term in the given interval.

To find a_0 . Integrate both sides of (1) w.r.t. x between the limits c to $c + 2\pi$.

$$\begin{aligned} \int_c^{c+2\pi} f(x) dx &= \frac{a_0}{2} \int_c^{c+2\pi} dx + \int_c^{c+2\pi} \left(\sum_{n=1}^{\infty} a_n \cos nx \right) dx + \int_c^{c+2\pi} \left(\sum_{n=1}^{\infty} b_n \sin nx \right) dx \\ &= \frac{a_0}{2} (c + 2\pi - c) + 0 + 0 \quad [\text{by formula (i) above}] \\ &= a_0 \pi \end{aligned}$$

$$\therefore a_0 = \frac{1}{\pi} \int_c^{c+2\pi} f(x) dx$$

To find a_n , multiply both sides of (1) by $\cos nx$ and integrate w.r.t. x between the limits c to $c + 2\pi$.

$$\begin{aligned} \int_c^{c+2\pi} f(x) \cos nx dx &= \frac{a_0}{2} \int_c^{c+2\pi} \cos nx dx + \int_c^{c+2\pi} \left(\sum_{n=1}^{\infty} a_n \cos nx \right) \cos nx dx \\ &\quad + \int_c^{c+2\pi} \left(\sum_{n=1}^{\infty} b_n \sin nx \right) \cos nx dx \\ &= 0 + a_n \pi + 0 \quad [\text{by formulae (i), (v) and (vi)}] \\ &= a_n \pi \end{aligned}$$

$$\therefore a_n = \frac{1}{\pi} \int_c^{c+2\pi} f(x) \cos nx dx$$

To find b_n , multiply both sides of (1) by $\sin nx$ and integrate w.r.t. x between the limits c to $c + 2\pi$.

$$\begin{aligned} \int_c^{c+2\pi} f(x) \sin nx dx &= \frac{a_0}{2} \int_c^{c+2\pi} \sin nx dx + \int_c^{c+2\pi} \left(\sum_{n=1}^{\infty} a_n \cos nx \right) \sin nx dx \\ &\quad + \int_c^{c+2\pi} \left(\sum_{n=1}^{\infty} b_n \sin nx \right) \sin nx dx \\ &= 0 + 0 + b_n \pi \quad [\text{by formulae (i), (vi) and (v)}] \\ &= b_n \pi \end{aligned}$$

$$\therefore b_n = \frac{1}{\pi} \int_c^{c+2\pi} f(x) \sin nx dx$$

These values of a_0 , a_n and b_n are called **Euler's formulae**

Cor. 1. If $c = 0$, the interval becomes $0 < x < 2\pi$, and the formulae reduce to

$$a_0 = \frac{1}{\pi} \int_0^{2\pi} f(x) dx ; \quad a_n = \frac{1}{\pi} \int_0^{2\pi} f(x) \cos nx dx ; \quad b_n = \frac{1}{\pi} \int_0^{2\pi} f(x) \sin nx dx$$

Cor. 2. If $c = -\pi$, the interval becomes $-\pi < x < \pi$, and the formulae reduce to

$$a_0 = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) dx ; \quad a_n = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \cos nx dx ; \quad b_n = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \sin nx dx$$

Cor. 3. When $f(x)$ is an odd function

$$a_0 = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) dx = 0$$

Since $\cos nx$ is an even function, therefore, $f(x) \cos nx$ is an odd function.

$$\therefore a_n = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \cos nx dx = 0$$

Since $\sin nx$ is an odd function, therefore, $f(x) \sin nx$ is an even function.

$$\therefore b_n = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \sin nx dx = \frac{2}{\pi} \int_0^{\pi} f(x) \sin nx dx$$

Hence, if a periodic function $f(x)$ is odd, its Fourier expansion contains only sine terms.

$$i.e., \quad f(x) = \sum_{n=1}^{\infty} b_n \sin nx, \quad \text{where} \quad b_n = \frac{2}{\pi} \int_0^{\pi} f(x) \sin nx dx$$

Cor. 4. When $f(x)$ is an even function

$$a_0 = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) dx = \frac{2}{\pi} \int_0^{\pi} f(x) dx$$

Since $\cos nx$ is an even function, therefore, $f(x) \cos nx$ is an even function.

$$\therefore a_n = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \cos nx dx = \frac{2}{\pi} \int_0^{\pi} f(x) \cos nx dx$$

Since $\sin nx$ is an odd function, therefore, $f(x) \sin nx$ is an odd function.

$$\therefore b_n = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \sin nx dx = 0$$

Hence, if a periodic function $f(x)$ is even, its Fourier expansion contains only cosine terms.

$$i.e., \quad f(x) = \frac{a_0}{2} + \sum_{n=1}^{\infty} a_n \cos nx, \quad \text{where} \quad a_0 = \frac{2}{\pi} \int_0^{\pi} f(x) dx \quad \text{and} \quad a_n = \frac{2}{\pi} \int_0^{\pi} f(x) \cos nx dx.$$

1.5. DIRICHLET'S CONDITIONS

(PTU Dec. 2008, 2012, 2013, May 2014)

The sufficient conditions for the uniform convergence of a Fourier series are called Dirichlet's conditions (after Dirichlet, a German mathematician). All the functions that normally arise in engineering problems satisfy these conditions and hence they can be expressed as a Fourier series.

Any function $f(x)$ can be expressed as a Fourier series $\frac{a_0}{2} + \sum_{n=1}^{\infty} a_n \cos nx + \sum_{n=1}^{\infty} b_n \sin nx$

where a_0, a_n, b_n are constants, provided

- (i) $f(x)$ is periodic, single valued and finite
- (ii) $f(x)$ has a finite number of finite discontinuities in any one period.
- (iii) $f(x)$ has a finite number of maxima and minima.

When these conditions are satisfied, the Fourier series converges to $f(x)$ at every point of continuity. At a point of discontinuity, the sum of the series is equal to the mean of the limits on the right and left

i.e., $\frac{1}{2}[f(x+0) + f(x-0)]$

where $f(x+0)$ and $f(x-0)$ denote the limit on the right and the limit on the left respectively.

EXAMPLES

Example 1. Find the Fourier series representing $f(x) = x$, $0 < x < 2\pi$.

Sol. Let the Fourier series be

$$f(x) = \frac{a_0}{2} + \sum_{n=1}^{\infty} a_n \cos nx + \sum_{n=1}^{\infty} b_n \sin nx \quad \dots(1)$$

where

$$a_0 = \frac{1}{\pi} \int_0^{2\pi} f(x) dx = \frac{1}{\pi} \int_0^{2\pi} x dx = \frac{1}{\pi} \left(\frac{x^2}{2} \right)_0^{2\pi} = 2\pi$$

$$\begin{aligned} a_n &= \frac{1}{\pi} \int_0^{2\pi} f(x) \cos nx dx = \frac{1}{\pi} \int_0^{2\pi} x \cos nx dx \\ &= \frac{1}{\pi} \left[\left(\frac{x \sin nx}{n} \right)_0^{2\pi} - \int_0^{2\pi} 1 \cdot \frac{\sin nx}{n} dx \right] \\ &= -\frac{1}{\pi n} \left(\frac{-\cos nx}{n} \right)_0^{2\pi} = \frac{1}{\pi n^2} (1 - 1) = 0 \end{aligned}$$

$$\begin{aligned} b_n &= \frac{1}{\pi} \int_0^{2\pi} f(x) \sin nx dx = \frac{1}{\pi} \int_0^{2\pi} x \sin nx dx \\ &= \frac{1}{\pi} \left[\left\{ x \cdot \left(\frac{-\cos nx}{n} \right) \right\}_0^{2\pi} - \int_0^{2\pi} 1 \cdot \left(\frac{-\cos nx}{n} \right) dx \right] \\ &= \frac{1}{\pi} \left[\frac{-2\pi}{n} + \frac{1}{n} \left(\frac{\sin nx}{n} \right)_0^{2\pi} \right] = -\frac{2}{n}. \end{aligned}$$

∴ From (1), $f(x) = \pi - 2 \sum_{n=1}^{\infty} \frac{\sin nx}{n}$.

Example 2. Prove that for all values of x between $-\pi$ and π ,

$$\frac{1}{2}x = \sin x - \frac{1}{2} \sin 2x + \frac{1}{3} \sin 3x - \frac{1}{4} \sin 4x + \dots$$

Sol. Here the given function $f(x)$ is odd in $(-\pi, \pi)$.
Hence, $a_0 = 0$ and $a_n = 0$.

Let the Fourier series be

$$f(x) = \frac{x}{2} = \sum_{n=1}^{\infty} b_n \sin nx \quad \dots(1)$$

where

$$b_n = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \sin nx \, dx = \frac{1}{\pi} \int_{-\pi}^{\pi} \frac{x}{2} \sin nx \, dx = \frac{1}{\pi} \int_0^{\pi} x \sin nx \, dx$$

$$= \frac{1}{\pi} \left[\left\{ x \cdot \left(\frac{-\cos nx}{n} \right) \right\}_0^{\pi} \int_0^{\pi} \left(\frac{-\cos nx}{n} \right) dx \right]$$

$$= \frac{1}{\pi} \left[\frac{-\pi}{n} \cos n\pi + \frac{1}{n} \left(\frac{\sin nx}{n} \right)_0^{\pi} \right] = \frac{1}{\pi} \left[\frac{-\pi}{n} (-1)^n \right] = \frac{-1}{n} (-1)^n$$

$$\therefore \text{From (1), } \frac{x}{2} = - \sum_{n=1}^{\infty} \frac{(-1)^n}{n} \sin nx = \sin x - \frac{1}{2} \sin 2x + \frac{1}{3} \sin 3x - \frac{1}{4} \sin 4x + \dots$$

Example 3. Obtain the Fourier series for $f(x) = e^{-x}$ in the interval $0 < x < 2\pi$.

(PTU Dec. 2010)

Sol. Let $f(x) = e^{-x} = \frac{a_0}{2} + \sum_{n=1}^{\infty} a_n \cos nx + \sum_{n=1}^{\infty} b_n \sin nx$

Then $a_0 = \frac{1}{\pi} \int_0^{2\pi} f(x) \, dx = \frac{1}{\pi} \int_0^{2\pi} e^{-x} \, dx = \frac{1}{\pi} \left[-e^{-x} \right]_0^{2\pi} = \frac{1 - e^{-2\pi}}{\pi}$

$$a_n = \frac{1}{\pi} \int_0^{2\pi} f(x) \cos nx \, dx = \frac{1}{\pi} \int_0^{2\pi} e^{-x} \cos nx \, dx$$

$$= \frac{1}{\pi} \left[\frac{e^{-x}}{1+n^2} (-\cos nx + n \sin nx) \right]_0^{2\pi} = \frac{1 - e^{-2\pi}}{\pi(1+n^2)}$$

$$b_n = \frac{1}{\pi} \int_0^{2\pi} f(x) \sin nx \, dx = \frac{1}{\pi} \int_0^{2\pi} e^{-x} \sin nx \, dx$$

$$= \frac{1}{\pi} \left[\frac{e^{-x}}{1+n^2} (-\sin nx - n \cos nx) \right]_0^{2\pi} = \frac{1 - e^{-2\pi}}{\pi} \cdot \frac{n}{1+n^2}$$

$$\therefore e^{-x} = \frac{1 - e^{-2\pi}}{2\pi} + \frac{1 - e^{-2\pi}}{\pi} \sum_{n=1}^{\infty} \frac{\cos nx}{1+n^2} + \frac{1 - e^{-2\pi}}{\pi} \sum_{n=1}^{\infty} \frac{n \sin nx}{1+n^2}$$

Example 4. Obtain the Fourier series to represent $f(x) = \frac{1}{4}(\pi - x)^2$ in the interval $[0, 2\pi]$.

Hence obtain the following relations:

$$(i) \frac{1}{1^2} + \frac{1}{2^2} + \frac{1}{3^2} + \frac{1}{4^2} + \dots = \frac{\pi^2}{6} \quad (ii) \frac{1}{1^2} - \frac{1}{2^2} + \frac{1}{3^2} - \frac{1}{4^2} + \dots = \frac{\pi^2}{12}$$

(PTU May 2014)

$$(iii) \frac{1}{1^2} + \frac{1}{3^2} + \frac{1}{5^2} + \dots = \frac{\pi^2}{8}.$$

Sol. Let $f(x) = \frac{1}{4}(\pi - x)^2 = \frac{a_0}{2} + \sum_{n=1}^{\infty} a_n \cos nx + \sum_{n=1}^{\infty} b_n \sin nx \quad \dots(1)$

By Euler's formulae, we have

$$a_0 = \frac{1}{\pi} \int_0^{2\pi} f(x) dx = \frac{1}{\pi} \int_0^{2\pi} \frac{1}{4}(\pi - x)^2 dx = \frac{1}{4\pi} \left[\frac{(\pi - x)^3}{-3} \right]_0^{2\pi} = -\frac{1}{12\pi} [-\pi^3 - \pi^3] = \frac{\pi^2}{6}$$

$$\begin{aligned} a_n &= \frac{1}{\pi} \int_0^{2\pi} f(x) \cos nx dx = \frac{1}{\pi} \int_0^{2\pi} \frac{1}{4}(\pi - x)^2 \cos nx dx \\ &= \frac{1}{4\pi} \left[(\pi - x)^2 \frac{\sin nx}{n} - \{-2(\pi - x)\} \left(-\frac{\cos nx}{n^2} \right) + 2 \left(-\frac{\sin nx}{n^3} \right) \right]_0^{2\pi} \\ &= \frac{1}{4\pi} \left(0 + \frac{2\pi \cos 2n\pi}{n^2} + 0 \right) - \left(0 - \frac{2\pi \cos 0}{n^2} + 0 \right) = \frac{1}{4\pi} \left[\frac{2\pi}{n^2} + \frac{2\pi}{n^2} \right] = \frac{1}{n^2} \end{aligned}$$

$$\begin{aligned} b_n &= \frac{1}{\pi} \int_0^{2\pi} f(x) \sin nx dx = \frac{1}{\pi} \int_0^{2\pi} \frac{1}{4}(\pi - x)^2 \sin nx dx \\ &= \frac{1}{4\pi} \left[(\pi - x)^2 \left(-\frac{\cos nx}{n} \right) - \{-2(\pi - x)\} \left(-\frac{\sin nx}{n^2} \right) + 2 \left(\frac{\cos nx}{n^3} \right) \right]_0^{2\pi} \\ &= \frac{1}{4\pi} \left[\left(-\frac{\pi^2 \cos 2n\pi}{n} - 0 + \frac{2 \cos 2n\pi}{n^3} \right) - \left(-\frac{\pi^2}{n} - 0 + \frac{2 \cos 0}{n^3} \right) \right] \\ &= \frac{1}{4\pi} \left[\left(-\frac{\pi^2}{n} + \frac{2}{n^3} \right) - \left(-\frac{\pi^2}{n} + \frac{2}{n^3} \right) \right] = 0 \end{aligned}$$

$$\therefore f(x) = \frac{\pi^2}{12} + \sum_{n=1}^{\infty} \frac{\cos nx}{n^2} = \frac{\pi^2}{12} + \frac{\cos x}{1^2} + \frac{\cos 2x}{2^2} + \frac{\cos 3x}{3^2} + \dots \quad \dots(2)$$

(i) Putting $x = 0$ in eqn. (2), we get

$$\begin{aligned} \frac{\pi^2}{4} &= \frac{\pi^2}{12} + \left(\frac{1}{1^2} + \frac{1}{2^2} + \frac{1}{3^2} + \frac{1}{4^2} + \dots \right) \\ \Rightarrow \frac{\pi^2}{6} &= \frac{1}{1^2} + \frac{1}{2^2} + \frac{1}{3^2} + \frac{1}{4^2} + \dots \quad \dots(3) \end{aligned}$$

(ii) Putting $x = \pi$ in eqn. (2), we get

$$\begin{aligned} 0 &= \frac{\pi^2}{12} + \left[\left(\frac{-1}{1^2} \right) + \frac{1}{2^2} + \left(\frac{-1}{3^2} \right) + \frac{1}{4^2} + \dots \right] \\ \Rightarrow \quad \frac{\pi^2}{12} &= \frac{1}{1^2} - \frac{1}{2^2} + \frac{1}{3^2} - \frac{1}{4^2} + \dots \end{aligned} \quad \dots(4)$$

(iii) Adding equations (3) and (4), we get

$$\begin{aligned} \frac{\pi^2}{6} + \frac{\pi^2}{12} &= 2 \left(\frac{1}{1^2} + \frac{1}{3^2} + \frac{1}{5^2} + \dots \right) \\ \Rightarrow \quad \frac{\pi^2}{8} &= \frac{1}{1^2} + \frac{1}{3^2} + \frac{1}{5^2} + \dots \end{aligned}$$

Hence the results.

Example 5. Expand $f(x) = x \sin x$, $0 < x < 2\pi$ as a Fourier series.

Sol. Let $f(x) = x \sin x = \frac{a_0}{2} + \sum_{n=1}^{\infty} a_n \cos nx + \sum_{n=1}^{\infty} b_n \sin nx$

By Euler's formulae, we have

$$\begin{aligned} a_0 &= \frac{1}{\pi} \int_0^{2\pi} f(x) dx = \frac{1}{\pi} \int_0^{2\pi} x \sin x dx \\ &= \frac{1}{\pi} \left[x(-\cos x) - 1 \cdot (-\sin x) \right]_0^{2\pi} = \frac{1}{\pi} [-2\pi] = -2 \\ a_n &= \frac{1}{\pi} \int_0^{2\pi} f(x) \cos nx dx = \frac{1}{\pi} \int_0^{2\pi} x \sin x \cos nx dx = \frac{1}{2\pi} \int_0^{2\pi} x(2 \cos nx \sin x) dx \\ &= \frac{1}{2\pi} \int_0^{2\pi} x[\sin(n+1)x - \sin(n-1)x] dx \\ &= \frac{1}{2\pi} \left[x \left\{ -\frac{\cos(n+1)x}{n+1} + \frac{\cos(n-1)x}{n-1} \right\} - 1 \cdot \left\{ -\frac{\sin(n+1)x}{(n+1)^2} + \frac{\sin(n-1)x}{(n-1)^2} \right\} \right]_0^{2\pi} \\ &= \frac{1}{2\pi} \left[2\pi \left\{ -\frac{\cos 2(n+1)\pi}{n+1} + \frac{\cos 2(n-1)\pi}{n-1} \right\} \right] \\ &= -\frac{1}{n+1} + \frac{1}{n-1} = \frac{2}{n^2-1}, \quad n \neq 1 \end{aligned}$$

When $n = 1$, we have

$$\begin{aligned} a_1 &= \frac{1}{\pi} \int_0^{2\pi} x \sin x \cos x dx = \frac{1}{2\pi} \int_0^{2\pi} x \sin 2x dx \\ &= \frac{1}{2\pi} \left[x \left(-\frac{\cos 2x}{2} \right) - 1 \cdot \left(-\frac{\sin 2x}{4} \right) \right]_0^{2\pi} = \frac{1}{2\pi} [-\pi] = -\frac{1}{2} \end{aligned}$$

$$\begin{aligned}

Sol. Let $x - x^2 = \frac{a_0}{2} + \sum_{n=1}^{\infty} a_n \cos nx + \sum_{n=1}^{\infty} b_n \sin nx$

By Euler's formulae, we have

Adding (2) and (3), we get

1.6. FOURIER SERIES FOR DISCONTINUOUS FUNCTIONS

In art. 1.4, we derived Euler's formulae for a_0, a_n, b_n on the assumption that $f(x)$ is continuous in $(c, c + 2\pi)$. However, if $f(x)$ has finitely many points of finite discontinuity, even then it can be expressed as a Fourier series. The integrals for a_0, a_n, b_n are to be evaluated by breaking up the range of integration.

Let $f(x)$ be defined by

$$f(x) = \begin{cases} f_1(x), & c < x < x_0 \\ f_2(x), & x_0 < x < c + 2\pi \end{cases}$$

where x_0 is the point of finite discontinuity in the interval $(c, c + 2\pi)$.

The values of a_0, a_n, b_n are given by

$$a_0 = \frac{1}{\pi} \left[\int_c^{x_0} f_1(x) dx + \int_{x_0}^{c+2\pi} f_2(x) dx \right]$$

$$a_n = \frac{1}{\pi} \left[\int_c^{x_0} f_1(x) \cos nx dx + \int_{x_0}^{c+2\pi} f_2(x) \cos nx dx \right]$$

$$b_n = \frac{1}{\pi} \left[\int_c^{x_0} f_1(x) \sin nx dx + \int_{x_0}^{c+2\pi} f_2(x) \sin nx dx \right]$$

At $x = x_0$, there is a finite jump in the graph of the function. Both the limits $f(x_0 - 0)$ and $f(x_0 + 0)$ exist but are unequal. The sum of the Fourier series $= \frac{1}{2}[f(x_0 - 0) + f(x_0 + 0)] = \frac{1}{2}(AB + AC) = AM$, where M is the mid-point of BC.

EXAMPLES

Example 1. Find the Fourier series for the periodic function

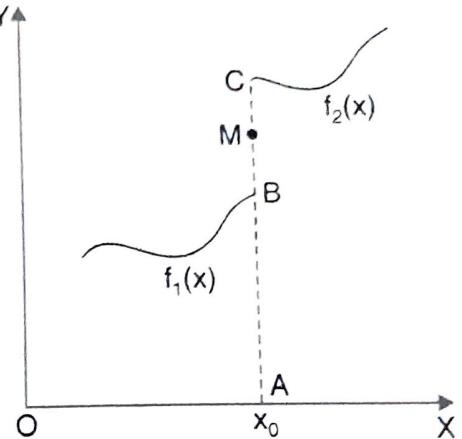

$$F(x) = \begin{cases} 0, & -\pi < x < 0 \\ x, & 0 < x < \pi \end{cases}; F(x + 2\pi) = F(x).$$

Sol. Let $F(x) = \frac{a_0}{2} + \sum_{n=1}^{\infty} a_n \cos nx + \sum_{n=1}^{\infty} b_n \sin nx$... (1)

$$\text{Here, } a_0 = \frac{1}{\pi} \int_{-\pi}^{\pi} F(x) dx = \frac{1}{\pi} \int_0^{\pi} x dx = \frac{1}{\pi} \left(\frac{x^2}{2} \right)_0^{\pi} = \frac{\pi}{2}$$

$$a_n = \frac{1}{\pi} \int_{-\pi}^{\pi} F(x) \cos nx dx = \frac{1}{\pi} \int_0^{\pi} x \cos nx dx$$

$$= \frac{1}{\pi} \left[\left(x \frac{\sin nx}{n} \right)_0^{\pi} - \int_0^{\pi} 1 \cdot \frac{\sin nx}{n} dx \right]$$

$$= -\frac{1}{\pi n} \left(\frac{-\cos nx}{n} \right)_0^\pi = \frac{1}{\pi n^2} [(-1)^n - 1] = \begin{cases} \frac{-2}{\pi n^2}, & n \text{ is odd} \\ 0, & n \text{ is even} \end{cases}$$

$$\begin{aligned} b_n &= \frac{1}{\pi} \int_{-\pi}^{\pi} F(x) \sin nx \, dx = \frac{1}{\pi} \int_0^{\pi} x \sin nx \, dx \\ &= \frac{1}{\pi} \left[\left\{ x \cdot \left(\frac{-\cos nx}{n} \right) \right\}_0^\pi - \int_0^{\pi} 1 \cdot \left(\frac{-\cos nx}{n} \right) dx \right] \\ &= \frac{1}{\pi} \left(\frac{-\pi}{n} \cos n\pi \right) = -\frac{1}{n} (-1)^n \end{aligned}$$

\therefore From (1),

$$\begin{aligned} F(x) &= \frac{\pi}{4} - \frac{2}{\pi} \sum_{\substack{n=1,3,5 \\ (n \text{ is odd})}}^{\infty} \frac{1}{n^2} \cos nx - \sum_{n=1}^{\infty} \frac{(-1)^n}{n} \sin nx \\ &= \frac{\pi}{4} - \frac{2}{\pi} \left[\frac{\cos x}{1^2} + \frac{\cos 3x}{3^2} + \frac{\cos 5x}{5^2} + \dots \right] + \left[\frac{\sin x}{1} - \frac{\sin 2x}{2} + \frac{\sin 3x}{3} - \dots \right]. \end{aligned}$$

Example 2. Find the Fourier series to represent the function $f(x)$ given by

$$f(x) = \begin{cases} x & \text{for } 0 \leq x \leq \pi \\ 2\pi - x & \text{for } \pi \leq x \leq 2\pi \end{cases}$$

Deduce that $\frac{1}{1^2} + \frac{1}{3^2} + \frac{1}{5^2} + \dots = \frac{\pi^2}{8}$.

Sol. Let $f(x) = \frac{a_0}{2} + \sum_{n=1}^{\infty} a_n \cos nx + \sum_{n=1}^{\infty} b_n \sin nx$, then

$$\begin{aligned} a_0 &= \frac{1}{\pi} \int_0^{2\pi} f(x) \, dx = \frac{1}{\pi} \left[\int_0^{\pi} x \, dx + \int_{\pi}^{2\pi} (2\pi - x) \, dx \right] \\ &= \frac{1}{\pi} \left[\left| \frac{x^2}{2} \right|_0^{\pi} + \left| 2\pi x - \frac{x^2}{2} \right|_{\pi}^{2\pi} \right] = \frac{1}{\pi} \left[\frac{\pi^2}{2} + (4\pi^2 - 2\pi^2) - \left(2\pi^2 - \frac{\pi^2}{2} \right) \right] = \pi \end{aligned}$$

$$\begin{aligned} a_n &= \frac{1}{\pi} \int_0^{2\pi} f(x) \cos nx \, dx = \frac{1}{\pi} \left[\int_0^{\pi} x \cos nx \, dx + \int_{\pi}^{2\pi} (2\pi - x) \cos nx \, dx \right] \\ &= \frac{1}{\pi} \left[\left| x \cdot \frac{\sin nx}{n} - 1 \cdot \left(-\frac{\cos nx}{n^2} \right) \right|_0^{\pi} + \left| (2\pi - x) \left(\frac{\sin nx}{n} \right) - (-1) \left(-\frac{\cos nx}{n^2} \right) \right|_{\pi}^{2\pi} \right] \\ &= \frac{1}{\pi} \left[\left(\frac{\cos n\pi}{n^2} - \frac{1}{n^2} \right) + \left(-\frac{\cos 2n\pi}{n^2} + \frac{\cos n\pi}{n^2} \right) \right] \end{aligned}$$

$$= \frac{1}{\pi n^2} [(-1)^n - 1 - 1 + (-1)^n] = \frac{2}{\pi n^2} [(-1)^n - 1] = \begin{cases} -\frac{4}{\pi n^2}, & \text{if } n \text{ is odd} \\ 0, & \text{if } n \text{ is even} \end{cases}$$

$$\begin{aligned} b_n &= \frac{1}{\pi} \int_0^{2\pi} f(x) \sin nx \, dx = \frac{1}{\pi} \left[\int_0^\pi x \sin nx \, dx + \int_\pi^{2\pi} (2\pi - x) \sin nx \, dx \right] \\ &= \frac{1}{\pi} \left[\left| x \left(-\frac{\cos nx}{n} \right) - 1 \cdot \left(-\frac{\sin nx}{n^2} \right) \right|_0^\pi + \left| (2\pi - x) \times \left(-\frac{\cos nx}{n} \right) - 1 \cdot \left(-\frac{\sin nx}{n^2} \right) \right|_\pi^{2\pi} \right] \\ &= \frac{1}{\pi} \left[-\frac{\pi \cos n\pi}{n} + \frac{\pi \cos n\pi}{n} \right] = 0 \\ \therefore f(x) &= \frac{\pi}{2} - \frac{4}{\pi} \left(\frac{\cos x}{1^2} + \frac{\cos 3x}{3^2} + \frac{\cos 5x}{5^2} + \dots \right) \end{aligned}$$

Putting $x = 0$, we get

$$0 = \frac{\pi}{2} - \frac{4}{\pi} \left(\frac{1}{1^2} + \frac{1}{3^2} + \frac{1}{5^2} + \dots \right) \Rightarrow \frac{\pi^2}{8} = \frac{1}{1^2} + \frac{1}{3^2} + \frac{1}{5^2} + \dots$$

Example 3. If $f(x) = \begin{cases} 0, & -\pi \leq x \leq 0 \\ \sin x, & 0 \leq x \leq \pi \end{cases}$

Prove that $f(x) = \frac{1}{\pi} + \frac{1}{2} \sin x - \frac{2}{\pi} \sum_{n=1}^{\infty} \frac{\cos 2nx}{4n^2 - 1}$.

Hence show that

$$(i) \frac{1}{1 \cdot 3} + \frac{1}{3 \cdot 5} + \frac{1}{5 \cdot 7} + \dots = \frac{1}{2} \quad (ii) \frac{1}{1 \cdot 3} - \frac{1}{3 \cdot 5} + \frac{1}{5 \cdot 7} - \dots = \frac{\pi - 2}{4}.$$

Sol. Let

$$f(x) = \frac{a_0}{2} + \sum_{n=1}^{\infty} a_n \cos nx + \sum_{n=1}^{\infty} b_n \sin nx$$

Then

$$a_0 = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \, dx = \frac{1}{\pi} \left[\int_{-\pi}^0 0 \, dx + \int_0^{\pi} \sin x \, dx \right] = \frac{2}{\pi}$$

$$= \frac{1}{2\pi} \left[-\frac{\cos(n+1)x}{n+1} + \frac{\cos(n-1)x}{n-1} \right]_0^{\pi}, \quad n \neq 1$$

$$= \frac{1}{2\pi} \left[-\frac{\cos(n+1)\pi}{n+1} + \frac{\cos(n-1)\pi}{n-1} + \frac{1}{n+1} - \frac{1}{n-1} \right]$$

$$= \frac{1}{2\pi} \left[-\frac{(-1)^{n+1}}{n+1} + \frac{(-1)^{n-1}}{n-1} + \frac{1}{n+1} - \frac{1}{n-1} \right]$$

$$= \begin{cases} \frac{1}{2\pi} \left(-\frac{1}{n+1} + \frac{1}{n-1} + \frac{1}{n+1} - \frac{1}{n-1} \right), & \text{when } n \text{ is odd} \\ \frac{1}{2\pi} \left(\frac{1}{n+1} - \frac{1}{n-1} + \frac{1}{n+1} - \frac{1}{n-1} \right), & \text{when } n \text{ is even} \end{cases}$$

$$= \begin{cases} 0, & \text{when } n \text{ is odd, i.e., } n = 3, 5, 7, \dots \\ -\frac{2}{\pi(n^2 - 1)}, & \text{when } n \text{ is even} \end{cases}$$

When $n = 1$, we have

$$\begin{aligned} a_1 &= \frac{1}{\pi} \int_0^\pi \sin x \cos x \, dx = \frac{1}{2\pi} \int_0^\pi \sin 2x \, dx = \frac{1}{2\pi} \left[-\frac{\cos 2x}{2} \right]_0^\pi = 0 \\ b_n &= \frac{1}{\pi} \int_{-\pi}^\pi f(x) \sin nx \, dx = \frac{1}{\pi} \left[\int_{-\pi}^0 0 \, dx + \int_0^\pi \sin x \sin nx \, dx \right] \\ &= \frac{1}{2\pi} \int_0^\pi 2 \sin nx \sin x \, dx = \frac{1}{2\pi} \int_0^\pi [\cos((n-1)x) - \cos((n+1)x)] \, dx \\ &= \frac{1}{2\pi} \left[\frac{\sin(n-1)x}{n-1} - \frac{\sin(n+1)x}{n+1} \right]_0^\pi = 0, \quad n \neq 1 \end{aligned}$$

When $n = 1$, we have

$$\begin{aligned} b_1 &= \frac{1}{\pi} \int_0^\pi \sin x \sin x \, dx = \frac{1}{2\pi} \int_0^\pi (1 - \cos 2x) \, dx = \frac{1}{2\pi} \left[x - \frac{\sin 2x}{2} \right]_0^\pi = \frac{1}{2} \\ \therefore f(x) &= \frac{1}{\pi} - \frac{2}{\pi} \left[\frac{\cos 2x}{2^2 - 1} + \frac{\cos 4x}{4^2 - 1} + \frac{\cos 6x}{6^2 - 1} + \dots \right] + \frac{1}{2} \sin x \\ &= \frac{1}{\pi} + \frac{1}{2} \sin x - \frac{2}{\pi} \sum_{n=1}^{\infty} \frac{\cos 2nx}{(2n)^2 - 1} \end{aligned} \quad \dots(1)$$

Putting $x = 0$ in (1), we have $0 = \frac{1}{\pi} - \frac{2}{\pi} \sum_{n=1}^{\infty} \frac{1}{4n^2 - 1}$

$$\Rightarrow \frac{1}{2} = \sum_{n=1}^{\infty} \frac{1}{4n^2 - 1} = \sum_{n=1}^{\infty} \frac{1}{(2n-1)(2n+1)} = \frac{1}{1 \cdot 3} + \frac{1}{3 \cdot 5} + \frac{1}{5 \cdot 7} + \dots$$

Putting $x = \frac{\pi}{2}$ in (1), we have $1 = \frac{1}{\pi} + \frac{1}{2} - \frac{2}{\pi} \sum_{n=1}^{\infty} \frac{\cos n\pi}{4n^2 - 1}$

$$\Rightarrow \frac{1}{2} - \frac{1}{\pi} = -\frac{2}{\pi} \sum_{n=1}^{\infty} \frac{(-1)^n}{4n^2 - 1}$$

$$\Rightarrow \frac{\pi - 2}{4} = -\sum_{n=1}^{\infty} \frac{(-1)^n}{(2n-1)(2n+1)} = -\left(-\frac{1}{1 \cdot 3} + \frac{1}{3 \cdot 5} - \frac{1}{5 \cdot 7} + \dots \right)$$

$$\Rightarrow \frac{1}{1 \cdot 3} - \frac{1}{3 \cdot 5} + \frac{1}{5 \cdot 7} - \dots = \frac{\pi - 2}{4}.$$

Example 4. Obtain Fourier series for the function $f(x)$ given by

$$f(x) = \begin{cases} 1 + \frac{2x}{\pi}, & -\pi \leq x \leq 0 \\ 1 - \frac{2x}{\pi}, & 0 \leq x \leq \pi \end{cases}$$

Hence deduce that $\frac{1}{1^2} + \frac{1}{3^2} + \frac{1}{5^2} + \dots = \frac{\pi^2}{8}$.

Sol. When $-\pi \leq x \leq 0$, $0 \leq -x \leq \pi$

$$\therefore f(-x) = 1 - \frac{2(-x)}{\pi} = 1 + \frac{2x}{\pi} = f(x)$$

When $0 \leq x \leq \pi$, $-\pi \leq -x \leq 0$

$$\therefore f(-x) = 1 + \frac{2(-x)}{\pi} = 1 - \frac{2x}{\pi} = f(x)$$

$\Rightarrow f(x)$ is an even function of x in $[-\pi, \pi]$. This is also clear from its graph which is symmetrical about the y -axis.

1.7. CHANGE OF INTERVAL

In many engineering problems, it is desired to expand a function in a Fourier series over an interval of length $2l$ and not 2π . In order to apply foregoing theory, this interval must be transformed into an interval of length 2π . This can be achieved by a transformation of the variable.

Consider a periodic function $f(x)$ defined in the interval $c < x < c + 2l$. To change the interval into one of length 2π , we put

$$\frac{x}{l} = \frac{z}{\pi} \quad \text{or} \quad z = \frac{\pi x}{l} \quad \text{so that}$$

$$\text{when } x = c, \quad z = \frac{\pi c}{l} = d \text{ (say)}$$

$$\text{and when } x = c + 2l, \quad z = \frac{\pi(c + 2l)}{l} = \frac{\pi c}{l} + 2\pi = d + 2\pi.$$

Thus the function $f(x)$ of period $2l$ in $(c, c + 2l)$ is transformed to the function $F(z) = f\left(\frac{z\pi}{l}\right)$, say, of period 2π in $(d, d + 2\pi)$ and the latter function can be expressed as the Fourier series

$$F(z) = \frac{a_0}{2} + \sum_{n=1}^{\infty} a_n \cos nz + \sum_{n=1}^{\infty} b_n \sin nz \quad \dots(1)$$

$$\text{where } a_0 = \frac{1}{\pi} \int_d^{d+2\pi} F(z) dz; \quad a_n = \frac{1}{\pi} \int_d^{d+2\pi} F(z) \cos nz dz; \quad \text{and} \quad b_n = \frac{1}{\pi} \int_d^{d+2\pi} F(z) \sin nz dz \quad \dots(2)$$

Now making the inverse substitution $z = \frac{\pi x}{l}$, $dz = \frac{\pi}{l} dx$

When $z = d$, $x = c$ and when $z = d + 2\pi$, $x = c + 2l$.

The expression (1) becomes $F(z) = f\left(\frac{\pi x}{l}\right) = f(x) = \frac{a_0}{2} + \sum_{n=1}^{\infty} a_n \cos \frac{n\pi x}{l} + \sum_{n=1}^{\infty} b_n \sin \frac{n\pi x}{l}$ and the coefficients a_0 , a_n , b_n from (2) reduce to

$$a_0 = \frac{1}{l} \int_c^{c+2l} f(x) dx; \quad a_n = \frac{1}{l} \int_c^{c+2l} f(x) \cos \frac{n\pi x}{l} dx; \quad \text{and} \quad b_n = \frac{1}{l} \int_c^{c+2l} f(x) \sin \frac{n\pi x}{l} dx$$

Hence the Fourier series $f(x)$ in the interval $c < x < c + 2l$ is given by

$$f(x) = \frac{a_0}{2} + \sum_{n=1}^{\infty} a_n \cos \frac{n\pi x}{l} + \sum_{n=1}^{\infty} b_n \sin \frac{n\pi x}{l}$$

$$\text{where } a_0 = \frac{1}{l} \int_c^{c+2l} f(x) dx, \quad a_n = \frac{1}{l} \int_c^{c+2l} f(x) \cos \frac{n\pi x}{l} dx$$

Cor. 1. If we put $c = 0$, the interval becomes $0 < x < 2l$ and the above results reduce to

$$a_0 = \frac{1}{l} \int_0^{2l} f(x) dx; \quad a_n = \frac{1}{l} \int_0^{2l} f(x) \cos \frac{n\pi x}{l} dx; \quad \text{and} \quad b_n = \frac{1}{l} \int_0^{2l} f(x) \sin \frac{n\pi x}{l} dx.$$

Cor. 2. If we put $c = -l$, the interval becomes $-l < x < l$ and the above results reduce to

$$a_0 = \frac{1}{l} \int_{-l}^l f(x) dx, \quad a_n = \frac{1}{l} \int_{-l}^l f(x) \cos \frac{n\pi x}{l} dx, \quad \text{and} \quad b_n = \frac{1}{l} \int_{-l}^l f(x) \sin \frac{n\pi x}{l} dx.$$

Cor. 3. If $f(x)$ is an even function, we have

$$a_0 = \frac{2}{l} \int_0^l f(x) dx, \quad a_n = \frac{2}{l} \int_0^l f(x) \cos \frac{n\pi x}{l} dx \quad \text{and} \quad b_n = 0$$

Cor. 4. If $f(x)$ is an odd function, we have

$$a_0 = 0, \quad a_n = 0 \text{ and } b_n = \frac{2}{l} \int_0^l f(x) \sin \frac{n\pi x}{l} dx.$$

EXAMPLES

Example 1. Obtain the Fourier series expansion of

$$f(x) = \left(\frac{\pi - x}{2} \right) \text{ for } \underline{0 < x < 2}$$

Sol. Let $f(x) = \frac{a_0}{2} + \sum_{n=1}^{\infty} a_n \cos \frac{n\pi x}{l} + \sum_{n=1}^{\infty} b_n \sin \frac{n\pi x}{l}$

Here, $l = 1$

$$\therefore \frac{\pi - x}{2} = \frac{a_0}{2} + \sum_{n=1}^{\infty} a_n \cos n\pi x + \sum_{n=1}^{\infty} b_n \sin n\pi x \quad \dots(1)$$

Here,

$$\begin{aligned} a_0 &= \frac{1}{l} \int_0^{2l} f(x) dx = \int_0^2 \left(\frac{\pi - x}{2} \right) dx \\ &= \frac{1}{2} \left(\pi x - \frac{x^2}{2} \right)_0^2 = \frac{1}{2} (2\pi - 2) = \pi - 1 \\ a_n &= \frac{1}{l} \int_0^{2l} f(x) \cos n\pi x dx = \int_0^2 \left(\frac{\pi - x}{2} \right) \cos n\pi x dx \\ &= \frac{1}{2} \left[\left\{ (\pi - x) \frac{\sin n\pi x}{n\pi} \right\}_0^2 - \int_0^2 (-1) \frac{\sin n\pi x}{n\pi} dx \right] \\ &= \frac{1}{2n\pi} \left(\frac{-\cos n\pi x}{n\pi} \right)_0^2 = 0 \end{aligned}$$

$$\begin{aligned} b_n &= \frac{1}{l} \int_0^{2l} f(x) \sin n\pi x dx = \int_0^2 \left(\frac{\pi - x}{2} \right) \sin n\pi x dx \\ &= \frac{1}{2} \left[\left\{ (\pi - x) \left(\frac{-\cos n\pi x}{n\pi} \right) \right\}_0^2 - \int_0^2 (-1) \left(\frac{-\cos n\pi x}{n\pi} \right) dx \right] \\ &= -\frac{1}{2n\pi} [(\pi - 2) - \pi] = \frac{1}{n\pi} \end{aligned}$$

Hence, from (1),

$$\frac{\pi - x}{2} = \frac{(\pi - 1)}{2} + \frac{1}{\pi} \sum_{n=1}^{\infty} \frac{1}{n} \sin n\pi x$$

Example 2. Find Fourier expansion for the function $f(x) = x - x^2$, $-1 < x < 1$.

Sol. Let $f(x) = \frac{a_0}{2} + \sum_{n=1}^{\infty} a_n \cos n\pi x + \sum_{n=1}^{\infty} b_n \sin n\pi x$ (Here $l = 2$)

Then $a_0 = \int_{-1}^1 (x - x^2) dx = \int_{-1}^1 x dx - \int_{-1}^1 x^2 dx = 0 - 2 \int_0^1 x^2 dx = -2 \left[\frac{x^3}{3} \right]_0^1 = -\frac{2}{3}$

$$a_n = \int_{-1}^1 (x - x^2) \cos n\pi x dx = \int_{-1}^1 x \cos n\pi x dx - \int_{-1}^1 x^2 \cos n\pi x dx$$

$$= 0 - 2 \int_0^1 x^2 \cos n\pi x dx = -2 \left[\left(x^2 \frac{\sin n\pi x}{n\pi} \right)_0^1 - \int_0^1 2x \cdot \frac{\sin n\pi x}{n\pi} dx \right]$$

$$= \frac{4}{n\pi} \int_0^1 x \sin n\pi x dx$$

$$= \frac{4}{n\pi} \left[\left\{ x \cdot \left(-\frac{\cos n\pi x}{n\pi} \right) \right\}_0^1 - \int_0^1 \left(-\frac{\cos n\pi x}{n\pi} \right) dx \right]$$

$$= -\frac{4}{n^2\pi^2} \cos n\pi = \frac{-4(-1)^n}{n^2\pi^2}$$

$$b_n = \int_{-1}^1 (x - x^2) \sin n\pi x dx = \int_{-1}^1 x \sin n\pi x dx - \int_{-1}^1 x^2 \sin n\pi x dx$$

$$= 2 \int_0^1 x \sin n\pi x dx - 0 = 2 \left[x \left(-\frac{\cos n\pi x}{n\pi} \right) - 1 \cdot \left(-\frac{\sin n\pi x}{n^2\pi^2} \right) \right]_0^1$$

$$= 2 \left[-\frac{\cos n\pi}{n\pi} \right] = \frac{-2(-1)^n}{n\pi}$$

$$\therefore x - x^2 = -\frac{1}{3} + \frac{4}{\pi^2} \left(\frac{\cos \pi x}{1^2} - \frac{\cos 2\pi x}{2^2} + \frac{\cos 3\pi x}{3^2} - \dots \right)$$

$$+ \frac{2}{\pi} \left(\frac{\sin \pi x}{1} - \frac{\sin 2\pi x}{2} + \frac{\sin 3\pi x}{3} - \dots \right)$$

Example 3. Find the Fourier series to represent $f(x) = x^2 - 2$, when $-2 \leq x \leq 2$.
Sol. Since $f(x)$ is an even function, $b_n = 0$.

Let $f(x) = x^2 - 2 = \frac{a_0}{2} + \sum_{n=1}^{\infty} a_n \cos \frac{n\pi x}{2}$

Then

$$a_0 = \frac{2}{2} \int_0^2 (x^2 - 2) dx = \left[\frac{x^3}{3} - 2x \right]_0^2 = \frac{8}{3} - 4 = -\frac{4}{3}$$

$$a_n = \frac{2}{2} \int_0^2 (x^2 - 2) \cos \frac{n\pi x}{2} dx$$

$$= \left\{ (x^2 - 2) \frac{\sin \frac{n\pi x}{2}}{\frac{n\pi}{2}} \right\}_0^2 - \int_0^2 (2x) \frac{\sin \frac{n\pi x}{2}}{\left(\frac{n\pi}{2} \right)} dx = -\frac{4}{n\pi} \int_0^2 x \sin \frac{n\pi x}{2} dx$$

$$\begin{aligned}
 &= -\frac{4}{n\pi} \left[\left\{ x \left(\frac{-\cos \frac{n\pi x}{2}}{\frac{n\pi}{2}} \right) \right\}_0^2 - \int_0^2 \left(\frac{-\cos \frac{n\pi x}{2}}{\frac{n\pi}{2}} \right) dx \right] \\
 &= \frac{8}{n^2\pi^2} (2 \cos n\pi) = \frac{16 \cos n\pi}{n^2\pi^2} = \frac{16(-1)^n}{n^2\pi^2} \\
 \therefore x^2 - 2 &= -\frac{2}{3} - \frac{16}{\pi^2} \left(\cos \frac{\pi x}{2} - \frac{1}{4} \cos \pi x + \frac{1}{9} \cos \frac{3\pi x}{2} - \dots \right).
 \end{aligned}$$

Example 4 Obtain Fourier series for function $f(x) = \begin{cases} \pi x, & 0 \leq x \leq 1 \\ \pi(2-x), & 1 \leq x \leq 2 \end{cases}$. Also deduce

that $\frac{1}{1^2} + \frac{1}{3^2} + \frac{1}{5^2} + \dots = \frac{\pi^2}{8}$.

(PTU Dec. 2012, May 2014)

Sol. Let $f(x) = \frac{a_0}{2} + \sum_{n=1}^{\infty} a_n \cos n\pi x + \sum_{n=1}^{\infty} b_n \sin n\pi x$

$$\text{Then } a_0 = \int_0^2 f(x) dx = \int_0^1 \pi x dx + \int_1^2 \pi(2-x) dx = \pi \left[\frac{x^2}{2} \right]_0^1 + \pi \left[2x - \frac{x^2}{2} \right]_1^2$$

$$\begin{aligned}

$$\begin{aligned}

Now, putting $x = 0$ in above series, we get

$$0 = \frac{\pi}{2} - \frac{4}{\pi} \left(\frac{1}{1^2} + \frac{1}{3^2} + \frac{1}{5^2} + \dots \right) \Rightarrow \frac{1}{1^2} + \frac{1}{3^2} + \frac{1}{5^2} + \dots = \frac{\pi^2}{8}$$

1.8. HALF RANGE SERIES

Sometimes it is required to expand a function $f(x)$ in the range $(0, \pi)$ in a Fourier series of period 2π or more generally in the range $(0, l)$ in a Fourier series of period $2l$.

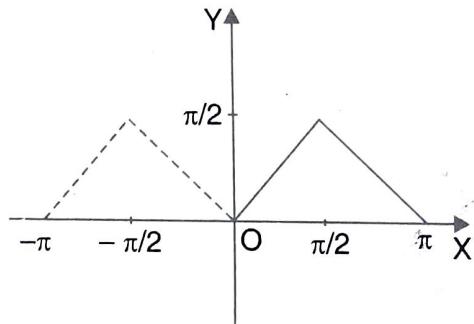

If it is required to expand $f(x)$ in the interval $(0, l)$, then it is immaterial what the function may be outside the range $0 < x < l$. We are free to choose it arbitrarily in the interval $(-l, 0)$.

If we extend the function $f(x)$ by reflecting it in the y -axis so that $f(-x) = f(x)$, then the extended function is even for which $b_n = 0$. The Fourier expansion of $f(x)$ will contain only cosine terms.

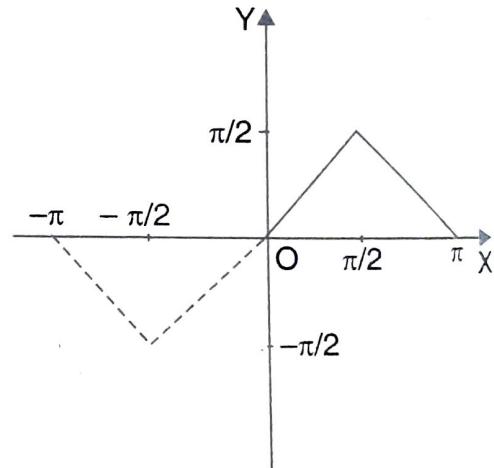

If we extend the function $f(x)$ by reflecting it in the origin so that $f(-x) = -f(x)$, then the extended function is odd for which $a_0 = a_n = 0$. The Fourier expansion of $f(x)$ will contain only sine terms.

For example, consider the function

$$f(x) = \begin{cases} x, & 0 < x < \frac{\pi}{2} \\ \pi - x, & \frac{\pi}{2} < x < \pi \end{cases}$$

(Reflection in the y -axis)

(Reflection in the origin)

Hence a function $f(x)$ defined over the interval $0 < x < l$ is capable of two distinct half-range series.

The half-range cosine series is

$$f(x) = \frac{a_0}{2} + \sum_{n=1}^{\infty} a_n \cos \frac{n\pi x}{l}$$

where

$$a_0 = \frac{2}{l} \int_0^l f(x) dx ; \quad a_n = \frac{2}{l} \int_0^l f(x) \cos \frac{n\pi x}{l} dx.$$

The half-range sine series is

$$f(x) = \sum_{n=1}^{\infty} b_n \sin \frac{n\pi x}{l}$$

where

$$b_n = \frac{2}{l} \int_0^l f(x) \sin \frac{n\pi x}{l} dx.$$

Cor. If the range is $0 < x < \pi$, then

(i) The half-range cosine series is

$$f(x) = \frac{a_0}{2} + \sum_{n=1}^{\infty} a_n \cos nx$$

where

$$a_0 = \frac{2}{\pi} \int_0^\pi f(x) dx ; \quad a_n = \frac{2}{\pi} \int_0^\pi f(x) \cos nx dx.$$

(ii) The half-range sine series is

$$f(x) = \sum_{n=1}^{\infty} b_n \sin nx$$

where

$$b_n = \frac{2}{\pi} \int_0^\pi f(x) \sin nx dx.$$

EXAMPLES

Example 1. Expand $\pi x - x^2$ in a half-range sine series in the interval $(0, \pi)$ upto the first three terms.

Sol. Let $\pi x - x^2 = \sum_{n=1}^{\infty} b_n \sin nx$, then

$$\begin{aligned} b_n &= \frac{2}{\pi} \int_0^\pi (\pi x - x^2) \sin nx dx \\ &= \frac{2}{\pi} \left[(\pi x - x^2) \left(-\frac{\cos nx}{n} \right) - (\pi - 2x) \left(-\frac{\sin nx}{n^2} \right) + (-2) \left(\frac{\cos nx}{n^3} \right) \right]_0^\pi \\ &= \frac{2}{\pi} \left[-\frac{2 \cos n\pi}{n^3} + \frac{2}{n^3} \right] = \frac{4}{\pi n^3} [1 - (-1)^n] \\ &= 0 \quad \text{or} \quad \frac{8}{\pi n^3} \quad \text{according as } n \text{ is even or odd.} \end{aligned}$$

$$\therefore \pi x - x^2 = \frac{8}{\pi} \left(\sin x + \frac{\sin 3x}{3^3} + \frac{\sin 5x}{5^3} + \dots \right).$$

Example 2. Expand $f(x) = x$ as a half-range

(i) sine series in $0 < x < 2$ (ii) cosine series in $0 < x < 2$. (PTU Dec. 2014)

Sol. (i) Let $x = \sum_{n=1}^{\infty} b_n \sin \frac{n\pi x}{2}$... (1)

where,

$$\begin{aligned} b_n &= \int_0^2 x \sin \frac{n\pi x}{2} dx \\ &= \left\{ x \left(\frac{-\cos \frac{n\pi x}{2}}{\frac{n\pi}{2}} \right) \right\}_0^2 - \int_0^2 \left(\frac{-\cos \frac{n\pi x}{2}}{\frac{n\pi}{2}} \right) dx \end{aligned}$$

$$= -\frac{4}{n\pi} \cos n\pi = -\frac{4}{n\pi} (-1)^n$$

Hence from (1),

$$x = -\frac{4}{\pi} \sum_{n=1}^{\infty} \frac{(-1)^n}{n} \sin \frac{n\pi x}{2}$$

$$(ii) \text{ Let } x = \frac{a_0}{2} + \sum_{n=1}^{\infty} a_n \cos \frac{n\pi x}{2} \quad \dots(2)$$

$$\text{where, } a_0 = \int_0^2 x \, dx = \left(\frac{x^2}{2} \right)_0^2 = 2$$

$$\text{and } a_n = \int_0^2 x \cos \frac{n\pi x}{2} \, dx = \left(x \frac{\sin \frac{n\pi x}{2}}{\frac{n\pi}{2}} \right)_0^2 - \int_0^2 \frac{\sin \frac{n\pi x}{2}}{\frac{n\pi}{2}} \, dx$$

$$= -\frac{2}{n\pi} \left(\frac{-\cos \frac{n\pi x}{2}}{\frac{n\pi}{2}} \right)_0^2 = \frac{4}{n^2 \pi^2} (\cos n\pi - 1)$$

$$\text{Hence, } x = 1 + \frac{4}{\pi^2} \sum_{n=1}^{\infty} \frac{(\cos n\pi - 1)}{n^2} \cos \frac{n\pi x}{2}$$

Example 3. Develop $\sin \left(\frac{\pi x}{l} \right)$ in half-range cosine series in the range $0 < x < l$.

$$\text{Sol. Let } \sin \left(\frac{\pi x}{l} \right) = \frac{a_0}{2} + \sum_{n=1}^{\infty} a_n \cos \frac{n\pi x}{l}$$

$$\text{then } a_0 = \frac{2}{l} \int_0^l \sin \frac{\pi x}{l} \, dx = \frac{2}{l} \left[-\frac{\cos \frac{\pi x}{l}}{\frac{\pi}{l}} \right]_0^l = -\frac{2}{\pi} [\cos \pi - 1] = \frac{4}{\pi}$$

$$a_n = \frac{2}{l} \int_0^l \sin \frac{\pi x}{l} \cos \frac{n\pi x}{l} \, dx \\ = \frac{1}{l} \int_0^l \left[\sin(n+1) \frac{\pi x}{l} - \sin(n-1) \frac{\pi x}{l} \right] \, dx$$

$$= \frac{1}{l} \left[-\frac{\cos(n+1) \frac{\pi x}{l}}{(n+1) \frac{\pi}{l}} + \frac{\cos(n-1) \frac{\pi x}{l}}{(n-1) \frac{\pi}{l}} \right]_0^l$$

$$= \frac{1}{\pi} \left[\left\{ -\frac{\cos(n+1)\pi}{n+1} + \frac{\cos(n-1)\pi}{n-1} \right\} - \left\{ -\frac{1}{n+1} + \frac{1}{n-1} \right\} \right]$$

$$= \frac{1}{\pi} \left[-\frac{(-1)^{n+1}}{n+1} + \frac{(-1)^{n-1}}{n-1} + \frac{1}{n+1} - \frac{1}{n-1} \right]$$

When n is odd, $a_n = \frac{1}{\pi} \left[-\frac{1}{n+1} + \frac{1}{n-1} + \frac{1}{n+1} - \frac{1}{n-1} \right] = 0$

$$\text{Then } a_0 = \frac{2}{\pi} \int_0^\pi x \sin x dx = \frac{2}{\pi} \left[x(-\cos x) - 1 \cdot (-\sin x) \right]_0^\pi = \frac{2}{\pi} [-\pi \cos \pi] = 2$$

$$a_n = \frac{2}{\pi} \int_0^\pi x \sin x \cos nx dx = \frac{1}{\pi} \int_0^\pi x (2 \cos nx \sin x) dx$$

$$\begin{aligned}

When $n = 1$, we have

$$\begin{aligned}
a_1 &= \frac{2}{\pi} \int_0^\pi x \sin x \cos x dx = \frac{1}{\pi} \int_0^\pi x \sin 2x dx = \frac{1}{\pi} \left[x \left(-\frac{\cos 2x}{2} \right) - 1 \cdot \left(-\frac{\sin 2x}{2^2} \right) \right]_0^\pi \\
&= \frac{1}{\pi} \left[-\frac{\pi \cos 2\pi}{2} \right] = -\frac{1}{2} \\
\therefore x \sin x &= 1 - \frac{1}{2} \cos x - 2 \left(\frac{\cos 2x}{1 \cdot 3} - \frac{\cos 3x}{2 \cdot 4} + \frac{\cos 4x}{3 \cdot 5} - \dots \right).
\end{aligned}$$

Putting $x = \frac{\pi}{2}$, we get

$$\begin{aligned}
\frac{\pi}{2} &= 1 - 2 \left(\frac{-1}{1 \cdot 3} + \frac{1}{3 \cdot 5} - \frac{-1}{5 \cdot 7} - \dots \right) \\
\Rightarrow \quad \frac{2}{1 \cdot 3} - \frac{2}{3 \cdot 5} + \frac{2}{5 \cdot 7} - \dots &= \frac{\pi}{2} - 1 \\
\text{Hence,} \quad \frac{1}{1 \cdot 3} - \frac{1}{3 \cdot 5} + \frac{1}{5 \cdot 7} - \dots &= \frac{\pi - 2}{4}.

Deduce the sum of the series $\frac{1}{1^2} + \frac{1}{3^2} + \frac{1}{5^2} + \dots$ (PTU May 2010, Dec. 2014)

Sol. Let $f(x) = \frac{a_0}{2} + \sum_{n=1}^{\infty} a_n \cos \frac{n\pi x}{l}$

When n is odd, $\cos \frac{n\pi}{2} = 0$ and $\cos n\pi = -1 \quad \therefore \quad a_n = 0 \quad \Rightarrow \quad a_1 = a_3 = a_5 = \dots = 0$

When n is even, $a_2 = \frac{2kl}{2^2\pi^2} [2 \cos \pi - 1 - \cos 2\pi] = -\frac{8kl}{2^2\pi^2}$;

$$a_4 = \frac{2kl}{4^2\pi^2} [2 \cos 2\pi - 1 - \cos 4\pi] = 0$$

$$a_6 = \frac{2kl}{6^2\pi^2} [2 \cos 3\pi - 1 - \cos 6\pi] = -\frac{8kl}{6^2\pi^2} \text{ and so on.}$$

$$\therefore f(x) = \frac{kl}{4} - \frac{8kl}{\pi^2} \left(\frac{1}{2^2} \cos \frac{2\pi x}{l} + \frac{1}{6^2} \cos \frac{6\pi x}{l} + \dots \right) \quad \dots(1)$$

Putting $x = l, f(l) = 0$

\therefore From (1), we have

$$0 = \frac{kl}{4} - \frac{8kl}{\pi^2} \left(\frac{1}{2^2} + \frac{1}{6^2} + \dots \right)$$

$$\Rightarrow \frac{1}{2^2} + \frac{1}{6^2} + \dots = \frac{\pi^2}{32} \Rightarrow \frac{1}{2^2} \left[\frac{1}{1^2} + \frac{1}{3^2} + \dots \right] = \frac{\pi^2}{32}$$

$$\text{Hence } \frac{1}{1^2} + \frac{1}{3^2} + \dots = \frac{\pi^2}{8}.$$

1.9. FOURIER SERIES OF DIFFERENT WAVEFORMS

Some typical waveforms usually met within communication engineering are:

(1) **Square waveform.** This waveform is the extension of the function

$$f(x) = \begin{cases} -k, & -\pi < x < 0 \\ k, & 0 < x < \pi \end{cases}$$

where $f(x + 2\pi) = f(x)$ and k is a constant. It has the graph as shown in the diagram:

Fourier series is

$$f(x) = \frac{4k}{\pi} \left(\sin x + \frac{\sin 3x}{3} + \frac{\sin 5x}{5} + \dots \right)$$

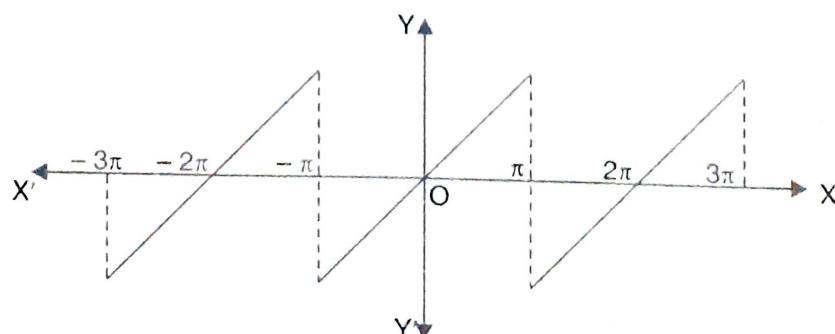

(2) **Saw-toothed waveform**

(PTU May 2012)

This waveform is the extension of the function

$$f(x) = x, \quad -\pi < x < \pi; \quad f(x + 2\pi) = f(x)$$

This function represents the discontinuous function called **saw-toothed waveform**. It has the graph as shown in the diagram:

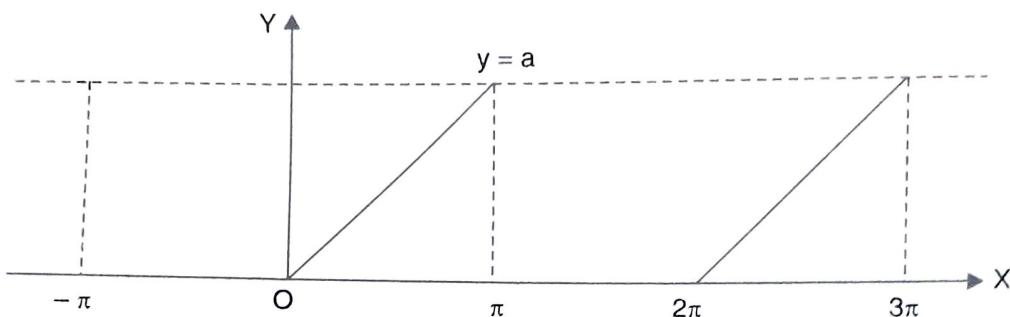

Fourier series is

$$f(x) = 2 \left[\sin x - \frac{1}{2} \sin 2x + \frac{1}{3} \sin 3x - \frac{1}{4} \sin 4x + \dots \right]$$

(3) **Modified saw-toothed waveform.** This wave is the extension of the function

$$f(x) = \begin{cases} 0, & -\pi < x \leq 0 \\ x, & 0 \leq x < \pi \end{cases}$$

It has the graph as shown in the diagram:

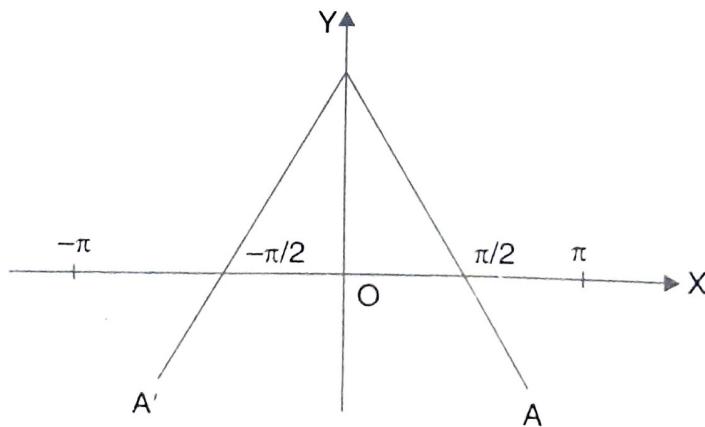

Fourier series is

$$F(x) = \frac{a}{4} - \frac{2a}{\pi^2} \left(\cos x + \frac{\cos 3x}{3^2} + \frac{\cos 5x}{5^2} + \dots \right) + \frac{a}{\pi} \left(\sin x - \frac{\sin 2x}{2} + \frac{\sin 3x}{3} - \dots \right)$$

(4) **Triangular waveform.** This waveform is the extension of the function
